# Background

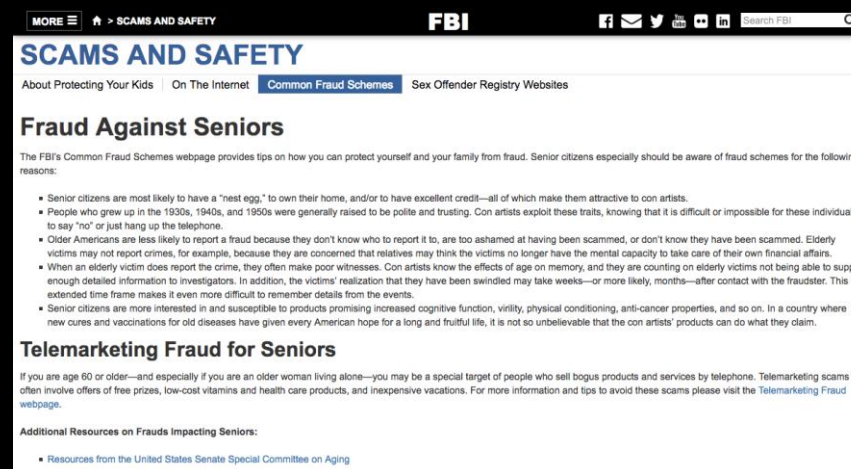

# Background

Metlife, Inc., 2011; True Link Financial, Inc., 2015

# Background

- Adults over the age of 65 hold 18.1 trillion of the 53.1 trillion (approximately 1/3rd) in U.S. household net worth (Laibson, 2011).
- A portion of older adults lose more than \$3 billion annually to financial scam or fraud (Metlife Inc., 2011), and some estimate this to be as high as \$36 billion (True Link Financial, 2015).
- The problem of financial and healthcare fraud targeted at elderly persons is so significant that the FBI maintains a website dedicated to the problem:

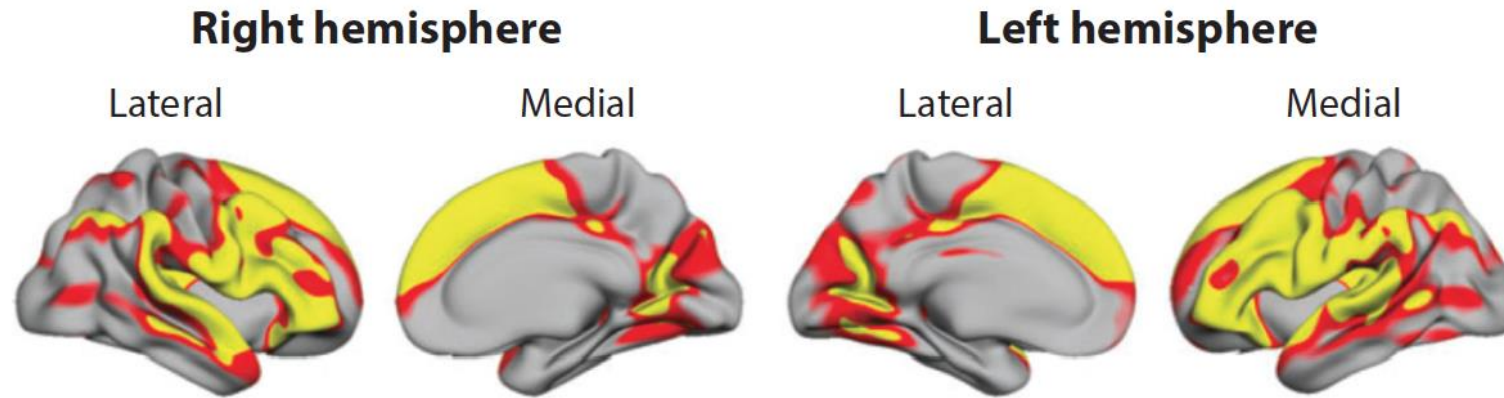

# Rationale

If an older adult becomes a victim of a scam, the burden is not only experienced by the older adult, but is often displaced upon family members, caregivers, and society.

*Therefore, understanding the susceptibility of older persons to fraud is a significant public health and policy concern, as this understanding may inform prevention and intervention strategies to promote health and wellbeing of older adults.*

➤ *How can we understand this?*

# Brain Structure Changes As We Age

**Figure 2**

Brain regions shown in yellow are those that exhibited the largest decline in cortical thickness with age across a sample of 883 participants ranging in age from 18 to 94 (Fjell et al. 2009b).

### Assessment of susceptibility to scams

The susceptibility to scams scale is a five-item self-report measure in which participants rated their agreement to a statement according to a 7-point Likert scale (strongly agree to strongly disagree). The five statements included in the measure have been previously reported (James et al. 2014) and address topics such as telemarketing behaviors, older adults being targeted by con-artists, and suspiciousness of claims that seem too good to be true. The statements are:

1. I answer the phone whenever it rings, even if I do not know who is calling.
2. I have difficulty ending a phone call, even if the caller is a telemarketer, someone I do not know, or someone I did not wish to call me.
3. If something sounds too good to be true, it usually is.
4. Persons over the age of 65 are often targeted by con-artists.
5. If a telemarketer calls me, I usually listen to what they have to say.

Each question corresponds to a Likert scale and has a total possible range of 1 to 7 (1 = strongly agree, 2 = agree, 3 = slightly agree, 4 = neither agree or disagree, 5 = slightly disagree, 6 = disagree, 7 = strongly disagree). The total score for susceptibility to scams was calculated by averaging the five items (with items 1, 2, and 5 reverse coded). The statements were based generally on findings from the AARP and the Financial Industry Regulatory Authority Risk Meter, a measure of poor and risky financial decision making that is widely used in finance studies (AARP 1999; Financial Industry Regulatory Authority 2013). The intraclass correla-

## The Finance, Cognition, and Health in Elders Study: Toward Preventing Financial Exploitation of Older Adults

By Gali H. Weissberger and S. Duke Han

February 28, 2018

Why is financial exploitation so common in the elderly population? Why do some older adults fare better than others when making financial decisions? What factors protect or place one at greater risk of being financially exploited? These are just some of the questions that a multidisciplinary team of investigators hope to answer through the Finance, Cognition, and Health in Elders Study (FINCHES) being

carried out through USC's Department of Family Medicine.

With strong support from the Elder Justice Foundation

See [www.hanresearchlab.com](http://www.hanresearchlab.com) for more details

The Value of Adding a Service Advocate to the

- Forensic Center

Coordinated response to help tribal elder victims of abuse needed: How do we address

- limited community services and supports?

# Finance, Cognition, and Health in Elders Study (FINCHES)

- The overall goal of FINCHES is to examine the association between financial exploitation in old age and physical, emotional, cognitive, and brain health outcomes.
- Non-cognitively impaired older adults who have experienced financial exploitation (FE) are recruited from the community and demographically matched to control participants.
- Methods include physical and mental health surveys, neuropsychological and neuroimaging assessments, and qualitative methodology.
- Pilot data collection began in 2017 with support from the [Elder Justice Foundation](#), current enrollment: **33 with FE and 26 controls**.
- Groups do not differ on demographic variables of **age** (FE: M=68.55, SD=11.99; non-FE: M=67.73, SD=11.81;  $t=0.261$ ,  $p=0.79$ ), **education** (FE: M=15.76, SD=2.52; non-FE: M=15.46, SD=2.76;  $t=0.429$ ,  $p=0.66$ ), **sex** (FE: 23 female/10 male; non-FE: 11 female/10 male,  $X^2=3.416$ ,  $p=0.06$ ), and **race** (FE: White=23; Black=2; Asian=5; Other=1; non-FE: White=15; Black=3; Asian=3; Other=1;  $X^2=2.908$ ,  $p=0.71$ ).

# Physical and mental health correlates of perceived financial exploitation in older adults: Preliminary findings from the Finance, Cognition, and Health in Elders Study (FINCHES)

## ABSTRACT

**Objectives:** Financial exploitation (FE) in old age is poorly understood, particularly among those without significant cognitive impairment. The Finance, Cognition, and Health in Elders Study (FINCHES) aims to identify factors associated with FE among cognitively-healthy older adults. Preliminary findings regarding physical and mental health correlates in the pilot phase of FINCHES are reported.

**Method:** Sixteen older adults who self-reported FE were demographically-matched on age, education, sex, and race/ethnicity to eighteen older adults who did not report past FE.

**Results:** Those who believed they were exploited endorsed significantly greater symptoms of depression ( $p = 0.014$ ) and marginally greater symptoms of anxiety ( $p = 0.062$ ). Participants trended towards lower perceived successful aging ( $p = 0.094$ ). Perceived FE participants also endorsed greater medical conditions ( $p = 0.047$ ), but follow-up individual item analyses suggest that this was driven by problems with sleep ( $p = 0.030$ ).

**Conclusions:** These preliminary findings from the pilot phase of FINCHES highlight negative mental health factors associated with perceived FE among cognitively-intact older adults.

# FINCHES Neuroimaging

- Older adults who self-reported a history of FE (N=15; M age=70.3, SD=9.1) and non-FE adults (N=16; M age=72.9, SD=9.9) underwent resting-state functional MRI.
- The left and right hippocampus were regions of interest prescribed based on the Harvard-Oxford atlas.
- Functional realignment and unwarping, slice-timing correction, structural segmentation and normalization, functional normalization, outlier detection, smoothing, and denoising were applied to scans.
- FC differences between groups were considered significant at an FDR-corrected two-sided cluster level of  $p < 0.05$ , and voxel level threshold of  $p < 0.008$ .
- Age, education, sex, and MoCA scores were included as covariates.

**1 BACKGROUND**

- Older adults are estimated to lose 3 billion to 36 billion annually to financial exploitation (FE). (MetLife, 2011; True Link Financial, 2015)
- Seniors are disproportionately impacted by scams, as assets lost in old age are often difficult to replace. (Nerenberg, 1999)
- Neural correlates of FE are poorly understood.
- The insula is involved in perceptions of trust (Castle et al., 2012); thus functional connectivity of the insula may be impacted by FE

**2 STUDY OBJECTIVE**

- The Finance, Cognition, and Health in Elders Study (FINCHES) aims to characterize the neuropsychological, psychosocial, economic preferences, and brain correlates of older adults who are victims of financial exploitation.
- The present study examined whole-brain functional connectivity of the insula in older adults with or without history of FE enrolled in the pilot phase of FINCHES.

**3 METHODS**

**Recruitment**

- National Center on Elder Abuse (NCEA), Center on Elder Mistreatment (CEM), health clinics, community organizations, and senior centers
- Inclusion criteria:** ≥50 years old, cognitively normal
- Exclusion criteria:** history of brain injury, stroke, major neurological or psychiatric illnesses, current substance abuse

**Sample**

- FE group:** 15 older adults self-reported a history of FE
- Non-FE group:** 16 older adults denied a history of FE

**Resting State fMRI**

- Acquisition:** 3T Siemens Magnetom; two EPI sequences (TR=607ms, TE=32.0ms, flip angle = 50°; 64 isocenter transversal slices parallel to the AC-PC line; reconstructed voxel size 2.5mm x 2.5mm x 2.5mm).
- Processing**
- SPM12 CONN toolbox
- Realignment and unwarping, slice-timing correction, structural segmentation and normalization, functional normalization, outlier detection, smoothing, and denoising
- ROIs:** left and right insula; prescribed based on the Harvard-Oxford atlas

**Data Analysis**

- Differences in insular functional connectivity between FE and non-FE groups
- FDR-corrected two-sided cluster level of  $p < 0.05$
- Voxel level threshold of  $p < 0.005$
- Covariates: age, education, sex, total score on MoCA

**4 RESULTS**

**Figure 1. Left Insula**

**Table 1. Demographics: No differences between groups**

	FE (n=15)		Non-FE (n=16)		
	M	SD	M	SD	p-value
Age	72.9	9.1	70.3	9.9	0.449
Education	16.4	2.5	15.7	2.6	0.449
Sex (%F)	67%	-	50%	-	0.473
Race (% non-white)	27%	-	31%	-	0.779
MoCA score	27.7	1.3	27.6	1.5	0.347

**Table 2. Significant clusters,  $p < 0.05$ , voxel  $p < 0.005$**

	Region of maximum intensity voxel	MNI Coordinates	Cluster size	t-Value <sup>1</sup>
Left Insula	1. Right superior parietal	24 -74 52	256	-4.93

<sup>1</sup>Positive value reflects FE>non-FE; models adjusted for age, education, sex, MoCA score

**Figure 2. Right Insula**

**5 DISCUSSION**

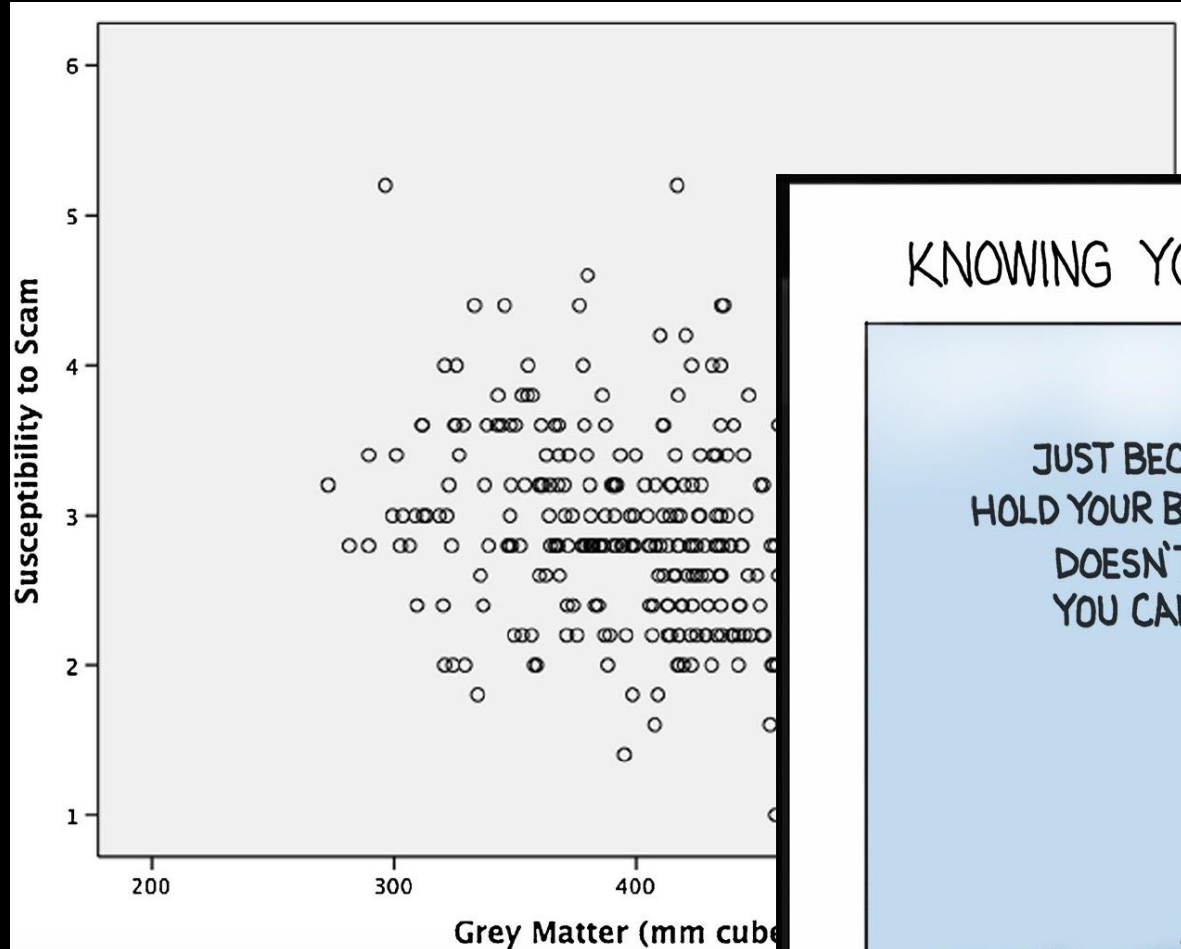

- In this preliminary rsfMRI analysis of the FINCHES pilot study, differences between FE and non-FE participants emerged in whole-brain functional connectivity (FC) with left and right insular cortices.
- FE older adults had significantly greater functional connectivity between the insula and regions in the bilateral temporal lobes than non-FE older adults.
- Non-FE older adults had greater connectivity between the insula and a region spanning right superior parietal cortex.
- Group differences in FC between the insula and the temporal lobe may implicate brain functional and network changes that occur as a consequence of financial exploitation, potentially due to changes in one's perception of trust following financial exploitation. (Castle et al., 2012)
- Decreased functional connectivity between the insula and superior parietal cortex in the FE group may reflect functional network changes that place one at increased risk of FE, possibly due to difficulty integrating sensory input in risky situations (Paulus et al., 2003; Wolpert et al., 1998).
- More research is needed to understand the directionality of relationships.

# Summary

- A complex functional and structural network of brain regions susceptible to age-related neuropathology may be involved in financial vulnerability in old age.
- Neuroimaging is a tool that can be used to examine brain characteristics of vulnerability *in vivo* ahead of any significant cognitive or behavioral change.
- Future neuroimaging work is needed to replicate findings, assess generalizability, and increase sensitivity and specificity of metrics.
- There are multiple factors (neurobiological, cognitive, emotional, social, medical, etc.) that are involved in financial vulnerability in old age.
